Viruses & Bacteria

Viruses and Bacteria

Viruses: including Colds, Flu, Epstein-Barr, Warts, Hepatitis, Shingles, Fever Blisters, Genital Herpes.

Bacteria: including Streptococcus, Staphylococcus, Stomach Ulcers, Bladder Infections, E-coli, Lyme Disease, and Ear, Eye, and Tooth Infections.

The BodyTalk System™ has a simple yet revolutionary approach to viruses and bacteria. This approach is becoming widely known for its effectiveness in many parts of the world where medical help and hygiene are minimal, financial support is non-existent, and diseases such as Tuberculosis, Malaria, AIDS, Cholera, and Yellow Fever are prevalent. It is also proving effective where strains of viruses and bacteria have adapted to become immune to antibiotics and other medications.

In the BodyTalk System, a specimen of the client's saliva is placed near the navel, an area rich in nerve endings, to help the body recognize and address microbes. Saliva is used because it contains information about all the viruses and bacteria present in the body.

A healthy reaction to a virus or bacterial infection is fever, in order to burn off microbes. But, if someone's system is already overwhelmed and does not react with a fever, a microbe may remain latent in the body, causing further illness, even autoimmune disorders.

▶ **The BodyTalk System™** re-establishes lines of communication within the body that have been blocked by exposure to viruses, bacteria, and day-to-day stresses that can break down the immune system. The body's own innate healing ability then mobilizes mechanisms to address viruses and/or bacteria, with the correct timing and sequence for each person.
